

How to use JLinkButton

JLinkButton inherit from JButton,it have all function of JButton, and it also have a additional function, you can open a Explorer via URL and that don't need write code.

There are two ways to use this function:

```
1.JLinkButton linkButton = new JLinkButton("www. baidu.com");
```

```
URL url = new URL("www.baidu.com");
```

```
linkButton.setURL(url);
```

```
2. URL url = new URL("www.baidu.com");
```

```
JLinkButton linkButton = new JLinkButton("www. baidu.com", url );
```

I saw LinkLabel in [.Net Framework Developer Center](#) before,it is convenient to use,but java don't include it. Now the third part Component include it,please see: [JComponentPack](#)
